3. Nguyễn Tiến Đạt – 2A2026000217
4. Nguyễn Mạnh Quyền – 2A2026000481
5. Vũ Quang Dũng – 2A2026000442

PROBLEM & OPPORTUNITY

Pain Point: Patients coming to Vinmec often do not know how to prepare before their appointment

Today, they have to:

- search scattered information on the website
- or call the hotline

Consequences:

- fasting incorrectly
- missing required documents
- arriving at the wrong time / waiting too long
- poor patient experience

→ Pre-visit preparation is fragmented, time-consuming, and not personalized

SOLUTION

The user answers 2–3 short questions:

- what they want to examine / what test they plan to take
- whether they already booked an appointment
- whether this is their first visit

The AI generates a personalized preparation checklist

- whether fasting is needed
- what documents to bring
- whether booking is recommended
- how early they should arrive

→ It turns general hospital information into a specific checklist for each visit

AI PRODUCT CANVAS

Value	Trust	Feasibility
• Users: new patients, returning patients, family members visiting on behalf of someone • Pain point: they do not know how to prepare • Value: reduce mistakes, save time, reduce repetitive calls	• AI only suggests, it does not replace doctors • If confidence is low, it asks follow-up questions or falls back to hotline support • Users can correct the checklist immediately	• Rule-based logic + lightweight AI question flow • Target latency: under 3 seconds • Low cost: around \$0.0003–0.001 per request

USER FLOW/ DEMO FLOW

Use a simple 4-step flow:

1. User opens the chatbot
2. AI asks 2–3 short questions
3. AI returns a personalized checklist
4. User:
 - accepts it
 - edits it
 - or calls the hotline for special cases

→ General blood test → fast for 8 hours, bring ID/insurance card, booking recommended, arrive 15 minutes early

WHY THIS WORKS / METRICS / ROI

Optimize for precision, because wrong-but-confident answers are more dangerous

Key metrics:

- checklist correctness $\geq 90\%$
- fasting-item precision $\geq 95\%$
- latency < 3 seconds

ROI:

- reduce repetitive hotline questions
- reduce preparation mistakes before visits
- improve the patient's entry experience

→ This is a small, focused, low-cost product that is easy to pilot and delivers real value
